RESEARCH INTERESTS

A scene is not a grid of pixels. It is a few things that persist when they leave view, carry properties, and act on one another – and it is over these, not over the array, that prediction and reasoning become possible at all. My interest centres on **object-centric representation learning**: recovering that decomposition from raw observation without supervision. I want to carry it into **world models and robot learning** – entity states rolled forward so an agent can weigh the consequences of an action before taking it, dynamics composed from interactions rather than one opaque transition. Structure is not a modelling convenience. It is what lets a few observations generalize to configurations never seen, and what makes a prediction something you can interrogate.

EDUCATION

University of Arkansas (UARK)
Department of Electrical Engineering and Computer Science (EECS)
Master of Sciences in Computer Science CGPA: 4.00/4.00 Expected Graduation: 2027

Vietnam National University Ho Chi Minh City (VNU-HCMC)
University of Information Technology (UIT)
Bachelor of Sciences in Computer Science GPA: 9.24/10.0 Graduation Rank: 1st - Valedictorian

EXPERIENCE

University of Arkansas - AICV Lab 2026 – Present

- Proposed a **fully self-supervised** object-centric video framework that decouples per-frame appearance from temporally persistent identity into two slot states, resolving the objective conflict between reconstruction and temporal consistency; evaluated on MOVi-C, MOVi-D, and YouTube-VIS (*DSSA*, ACM MM '26, co-first author).
- Designed a slot-lifecycle mechanism that learns a per-slot, per-frame activation score **without visibility supervision**, preserving latent state for absent or fully occluded objects and preventing state drift and decoder interference (*TSA*, under review, co-first author).
- Built a hierarchical **vision-language-action** framework combining a persistent semantic-graph state with a synthesized code-based planner for non-Markovian long-horizon robot manipulation under partial observability (*CodeGraphVLP*, under review, co-first author).

Day One Company - AI Lab 2024 – 2025

- Proposed a **self-supervised** pipeline enabling OCR models to adapt to new customer domains without annotation effort, reducing onboarding cost by 45%.
- Built information extraction systems generalizing across a wide variety of unseen receipt layouts; raised end-to-end automation from 60% to 90% and reached 99% accuracy on fraudulent-field detection.
- Led research & development, deployment, and maintenance of these AI products in production, including the MLOps pipeline and monitoring system.

UIT - AI Lab 2021 – 2024

- Designed region-aware pose encodings and **signer-invariant** learning strategies that bridge domain gaps across individuals for signer-independent sign language recognition (2 papers, ICCV Workshop 2025; 2nd place, MSLR Challenge).
- Built **multimodal fusion** pipelines combining vision-language embeddings (CLIP, BLIP), OCR, and ASR with temporal modeling for retrieval over 300+ hours of video (SOICT 2023, first author).
- Developed object detection robust to severe class imbalance and adverse visual conditions in real-world traffic footage (CVPR Workshop; 1st place, 8th AI City Challenge).

HONORS AND AWARDS

Graduate Assistantship Award, UARK	2026
Ranked 2nd, Multimodal Sign Language Recognition Challenge, ICCV Workshop	2025
Winner, 8th AI City Challenge, CVPR Workshop	2024
Valedictorian, Bachelor's degree, UIT	2024
Second Prize, Central-Level Science and Technology Awards	2024
2nd Runner Up, FPT AI Challenge	2023
Third Prize, Ho Chi Minh AI Challenge	2023
BOSCH Activator Scholarship in Ambassador	2023
Second Prize, UIT AI Challenge	2022
UIT Scholarships for Outstanding Students	2022–2024
